---

Eric

Here is an updated version of the file I sent earlier.

After fitting each job separately (forcing b to be constant across jobs), I then averaged across jobs.

The graph on the middle right compares the current results to what you get if you do it the old way

As seen, there is almost no difference (!)

I did not expect that, but in my opinion, it is still conceptually better to do the fitting by job and then average, even if you get the same answer.

Let me know what you think.
